Euryglossa chrysoceras, Ckl., and E. subsericea, Ckll.

A male E. chrysoceras comes from The Ridges, Mackay, Queensland, at flowers of Leptospermum, Oct. 1898 (Turner, 702). British Museum. At the same flowers were taken females of E. subsericea, Ckl., and these also bear the number 702, being evidently conspecific with chrysoceras. The two insects are so different that it seems improbable that they can be sexes of one, and, moreover, I believe the true male of E. subsericea to be Turner's 1 a, taken in some numbers at flowers of Leptospermum, at the same locality, Sept. and Oct. 1898. This insect has every appearance of E. subsericea, except for the usual sexual differences and the fact that the head and thorax are dark green instead of black. A very characteristic feature, seen in both sexes, is the dull minutely sculptured front, abruptly contrasting with the shining strongly punctured vertex. The abdomen of the male is shining, in the female it is dull. The venation varies, the first r. n. sometimes squarely meeting the first t. c. The male (Turner's 1 a) is the insect mentioned by Baker (‘Invertebrata Pacifica,’ May 1906, p. 141) as Stilposoma turneri. Prof. Baker has kindly sent me his specimen, which proves to be from Mackay, Sept. 1898, collected by Turner, the name S. turneri being a manuscript one by Friese.

XVII.—Descriptions of some new Species of Heterocera from East and West Africa and Tropical South America. By Herbert Druce, F.L.S. &c.

Fam. Agaristidæ.

Copidryas peruviana, sp. n.

Male.—Head, collar, tegulae, and thorax brown, thickly irrorated with grey hairs; antennæ and palpi black; abdomen yellow, with a black tuft of hairs at the base, the underside greyish yellow, the legs yellow. Primaries pale brown, thickly irrorated with white and greenish-coloured scales; two zigzag black lines cross the wing beyond the cell from the costal to the inner margin; a small brown spot in the cell; the inner margin brown from the base to the anal angle; the fringe alternately brown and white: secondaries chrome-yellow, bordered with black from the apex almost to the anal angle;
the fringe alternately black and grey. Underside of both wings pale yellow, irroration with brown scales: primaries with a black dot at the end of the cell, and beyond a broken black bar that does not reach either margin, the apex and outer margin brown.—Female the same as the male, but rather darker in colour.

Expanse 2 3/4 inches.

Hab. S.E. Peru, Santo Domingo, 6000 feet, wet season (G. Ockenden, Mus. Druce).

**Tuerta rema, sp. n.**

**Male.**—Head, palpi, and antennæ black, the base of the antennæ white; collar, tegulae, and thorax reddish brown, thickly irroration with white hairs; abdomen pale yellow. Primaries: the costal half of the wing from the base to beyond the cell white, the outer half of the cell pale green; a reddish-brown band extends from the apex to the anal angle and along the inner margin to the base of the wing thickly irroration with white scales, the inner side of the brown band broadly olive-green, the outer margin and fringe white: secondaries pale yellow, the fringe white; a small black line close to the anal angle. Underside of both wings uniformly pale yellow.

Expanse 1 1/2 inch.

Hab. German East Africa (Mus. Druce).

**Fam. Arctidæ.**

**Diacrisia pales, sp. n.**

**Male.**—Head, collar, tegulae, and front of the thorax orange-yellow, the thorax and basal part of the abdomen pale yellow, antennæ and legs black, the abdomen black, the anus yellow. Primaries pale yellow: secondaries yellowish white, darkest along the inner margin.—The female the same as the male.

Expanse 1 3/4 inch.

Hab. German East Africa (Mus. Druce).

Allied to *Diacrisia lurida*, Druce.

**Lophocampa dissimilis, sp. n.**

**Male and female.**—Head chrome-yellow; palpi and antennæ black; collar white, edged with chrome-yellow; tegulae chrome-yellow, edged with white; thorax and abdomen black, some yellowish-brown hairs at the base of the
thorax, abdomen spotted with yellow on the upper side and sides, the two anal segments, the anus, and underside yellowish white; the legs black. Primaries sordid white, the apex and part of the outer margin clouded with pale brown, the veins and a bar at the end of the cell pale brown, the fringe greyish white; secondaries similar to the primaries, but more dusky on the inner margin.

Expanse, ♂ 2, ♀ 2⅔ inches.

Hab. Peru, Chanchamayo, 1000 to 1500 metres (Mus. Druce).

This species is allied to *Lophocampa humosa*, Dogn., from Ecuador.

*Pericopsis imitata*, sp. n.

Male.—Head, antennae, collar, thorax, base of the abdomen, and legs black; two yellow spots at the back of the head and two at the base of the primaries; abdomen black, with a row of bluish-grey spots on each side, below which on the sides a row of very minute white dots; the underside spotted with yellow; the anal tuft bright red. Primaries very similar to those of *P. arema*, Boisd., but browner and not so hyaline, without the broad black band across the wing at the end of the cell as in *P. arema*; a faint marginal zigzag line extends from the apex to the anal angle; the fringe black; secondaries pale yellowish white, very broadly bordered with black at the end of the cell; two yellowish-white spots; a marginal row of white spots from near the apex to the anal angle. The underside very similar to the underside, a red spot at the base of both wings.

Expanse, ♂ ♀, 3 inches.

Hab. Peru, Limbani, Carabaya, 9500 feet, 3 ♂, 1 ♀; Rio Huacamayo, 3100 feet, 2 ♂; Oconeque, 7000 feet, 1 ♂; Aqualani, 10,000 feet, 4 ♂ (*G. Ockenden*). Brazil, 1 ♂ (ex Staudinger, Mus. Druce).

Near *P. arema*, Boisd., but at once distinguished from that species by the bluish-grey sides to the abdomen.

*Pericopsis titan*, sp. n.

Female.—Head, antennae, palpi, collar, tegulae, thorax, abdomen, and legs all black; collar spotted with white; a yellow spot at the base of the tegulae; the sides of the abdomen greenish grey, with a row of white dots below the underside yellow. Primaries blackish grey, marked with black very much the same as *Pericopsis imitata*, Druce: secondaries white, broadly bordered with black; two white spots just
new Species of Heterocera. 171

beyond the cell; the veins black; a marginal row of rather large white spots extends from the apex to the anal angle. Underside similar to the upperside; a large red spot at the base of both wings and a white spot on each side of the thorax.

Expanse 3 inches.

_Hab._ Peru, Chanchamayo, 1000 to 1500 metres (Mus. Druce).

**Pericopsis palmeri**, sp. n.

*Male._—Head, antennæ, collar, tegulæ, thorax, and legs black; tegulæ edged with yellow; abdomen black; a row of large yellow spots on both sides; the underside yellow; anal tuft red. Primaries dark brown; a red spot at the base; a yellow streak on the inner margin; the semihyaline markings very similar to those of *Pericopsis imitata*, Druce, but mostly edged with yellow; the spot in the cell extends to the base; a fine submarginal yellow line extends from the apex to the anal angle; the fringe dark brown: secondaries white, the veins and a bar at the end of the cell black; the outer margin broadly black, with a row of red spots from the apex to the anal angle and a marginal row of white dots also from the apex to the anal angle. Underside: primaries the same as above, but with several reddish marks along the outer margin: secondaries similar to the upperside, the costal margin red._—*Female._ Head, antennæ, collar, tegulæ, and thorax black; abdomen the same as the male. Primaries brown, the markings much more indistinct: secondaries pale yellow, very broadly bordered with black; a yellow spot at the end of the cell; the costal margin red; the marginal red and white spots the same as the male; the fringe black. Underside: primaries very similar to the upperside, but much paler in colour: secondaries the same as the upperside, with all the red markings very bright in colour; the white row of marginal spots are larger and more distinct.

Expanse, Σ 2 3/4, ♀ 3 1/2 inches.

_Hab._ West Colombia, San Antonio, 5800 feet (G. M. Palmer); East Peru, Puzuzo (J. Egg, 2000–4000 feet, Mus. Druce).

**Pericopsis damon**, sp. n.

*Female._—Head, antennæ, collar, tegulæ, and thorax black, the head, collar, and tegulæ spotted with white; abdomen black above, yellowish white on the underside; legs black. Primaries dusky hyaline, the apex, outer and inner
margin broadly black; two black bands cross the wing, that nearest the base from the costal to the inner margin; the band at the end of the cell from the costal to the outer margin; the veins all black; secondaries yellowish hyaline, broadly bordered with black from the apex to the anal angle; a marginal row of rather large white spots extends from the apex to the anal angle; a black band crosses the wing at the end of the cell from the costal to about the middle of the outer margin; the veins and fringe black. Underside very similar to the upperside, but slightly more yellow in tone.

Expanse $3\frac{1}{2}$ inches.

*Hab.* Peru, Chanchamayo, 1000–1500 metres (*Mus. Druce*).

**Pericopis semirufa**, sp. n.  

*Female.*—Head and antennæ black, head spotted with white; collar black, spotted with yellow; tegulæ black, with a yellow spot at the base; thorax brownish black; abdomen reddish brown, yellow on the underside; legs black. Primaries brownish hyaline, the costal margin, apex, outer and inner margin, and two bands crossing the wing all black; secondaries reddish hyaline, the outer margin black, with a marginal row of white spots extending from the apex to the anal angle; above the black margin a red band extends from the apex to the anal angle; the fringe black. Underside very similar to the upperside; primaries with a red band at the apex and a reddish spot above the anal angle; secondaries with the costal margin red.

Expanse $3\frac{3}{4}$ inches.

*Hab.* Peru, Chanchamayo, 1000–1500 metres (*Mus. Druce*).

**Pericopis sylvia**, sp. n.  

*Female.*—Head, palpi, antennæ, collar, tegulæ, and thorax black, collar and tegulæ spotted with white; abdomen grey, the sides black; the underside pale yellow; legs black. Primaries greyish hyaline, the costal margin, apex, outer and inner margin black; a reddish-brown line extends along the inner margin from the base nearly to the apex; a black band crosses the wing about the middle of the cell from the costal to the inner margin; a black band at the end of the cell, a few white dots at the apex, and several indistinct brown spots on the inner side of the white dots; secondaries semihyaline white, the veins and a bar at the end of the cell black; the outer margin broadly black from the apex to the anal angle,
and a marginal row of rather large white spots. Underside very similar to the upperside, but with the costal margin of the secondaries from the base almost to the apex chrome-yellow.

Expanse 3½ inches.

_Hab._ Peru, Chanchamayo, 1000–1500 metres (_Mus. Druce_).

*Pericopis madana*, sp. n.

**Female.**—Head, palpi, antennæ, collar, tegulæ, thorax, and abdomen black, the collar spotted with white, abdomen with a bluish-grey band on each side; the underside pale yellow; legs black. Primaries brownish grey, the apex, inner margin, and two bands crossing the wings all black; several small white spots at the apex, below which are some indistinct reddish-brown spots, also two reddish-brown spots close to the anal angle; a bright red spot at the base; secondaries white, the veins all black; the inner half of the wing thickly clothed with black hairs; the outer margin broadly bordered with black, with a submarginal row of indistinct reddish spots and a marginal row of white spots extending from the apex to the anal angle; the fringe black. Underside similar to the upperside, but with nearly all the black markings red.

Expanse 3 inches.

_Hab._ West Colombia, San Antonio, 5800 feet (_G. M. Palmer, Mus. Druce_).

A very distinct species, quite unlike any other known to me.

*Pericopis hodeva*, sp. n.

**Female.**—Head, antennæ, collar, tegulæ, thorax, and legs all black; collar spotted with yellow, tegulæ edged with reddish brown; abdomen above reddish brown, with a central black line down the middle from the base to the anus; a double black line on each side; the underside pale yellow; the anal segment bluish grey. Primaries: the apical third of the wing black, from the end of the cell to the base brownish yellow, clouded in the cell and along the inner margin with brown; the veins black; the fringe black; a yellow line at the end of the cell; secondaries black, yellowish brown at the apex and half round the outer margin. Underside very similar to the upperside, but brighter in colour, and a distinct black spot about the middle of the cell on the primaries.

Expanse 3½ inches.

_Hab._ Peru, Puzuzo (_Mus. Druce_).
Pericoris rhea, sp. n.

*Female.*—Head, palpi, antennæ, collar, and tegulæ black, collar spotted with yellow; thorax yellowish brown, clothed with some black hairs; abdomen yellowish brown, with a central black line from the base to the anus; a narrow black line on each side; the underside pale yellow. Primaries: the apical third of the wing brownish black, the other two-thirds of the wing dark orange-yellow, the veins black; a black bar at the end of the cell and an ill-defined black band crossing the wing from the costal margin to the upserside of vein 2; the fringe black: secondaries dark orange-yellow, the outer margin and a wide band partly across the middle of the wing below the cell black. Underside very similar to the upserside, but brighter in colour.

Expanse 3½ inches.

*Hab.* Peru, Pachitea (*Mus. Druce*).

Pericoris staudingeri, sp. n.

*Female.*—Head, palpi, antennæ, collar, tegulæ, and thorax black, head and tegulæ spotted with white; abdomen red, with a central black band extending from the base to the anus; a black band on each side; the underside yellow; legs black. Primaries brownish black, crossed from the costal margin nearest the apex to the anal angle by a cream-coloured wide band; a black bar at the end of the cell: secondaries bright red, the outer margin black from the apex to the anal angle; a broken black band crosses the wing below the middle. Underside very similar to the upserside, with the inner margin of the primaries yellowish brown; the secondaries with a large round yellow spot at the end of the cell.

Expanse 3½ inches.

*Hab.* Peru, Cuzco (received from the late Dr. Staudinger); S.E. Peru, Santo Domingo, 6000 feet (*G. Ockenden, Mus. Druce*).

Pericoris buckleyi, sp. n.

*Female.*—Head, palpi, antennæ, collar, tegulæ, thorax, abdomen, and legs black. Primaries dark brown, darkest at the base; a red spot on the costal margin close to the base; the fringe dark brown: secondaries black, three pale yellow spots between veins 5, 6, and 7 near the apex; a rose-coloured band extending from the anal angle to vein 4; the
fringe black. The underside the same as the upperside: the secondaries with a red spot at the base.

Expanse 4 inches.

Hab. Ecuador, Sarayacu (C. Buckley, Mus. Druce).

*Pericopsis salome*, sp. n.

**Female.**—Head, palpi, antennæ, collar, tegulæ, thorax, abdomen, and legs black. Primaries dark brown, very similar to *Pericopsis rosea*, Butler; secondaries black; a yellow spot at the end of the cell and one beyond nearest the apex; a wide rose-coloured band extends from the inner margin to the cell, the outer margin of the band broken into streaks; the fringe black. Underside of the primaries dark brown; four pale yellow spots beyond the cell and a pale yellow band from the end of the cell to the inner margin above the apex: secondaries the same as above, but browner in colour.

Expanse 2½ inches.

Hab. Ecuador (C. Buckley, Mus. Druce).

*Pericopsis unxia*, sp. n.

**Male.**—Head, palpi, and antennæ black; collar black, with four yellow spots; tegulæ black, with a large yellow spot at the base; thorax black; abdomen yellow, a central black line extends from the base to the anus, a black line on each side; the underside pale yellow, the anal tuft orange; legs black and yellow. Primaries dusky hyaline, very similar to those of *Pericopsis sibylla*, Butler; a marginal row of small white dots extends from the apex to the anal angle: secondaries very pale yellow, broadly bordered with black; a marginal row of small white dots extending from the apex to the anal angle; a fine black line crosses the wing beyond the cell; an indistinct red line at the apex; the fringe black. Underside very similar to the upperside, but much more yellow in colour; the costal margin of the secondaries reddish brown; a red spot at the base of all the wings.

Expanse 2¾ inches.

Hab. Peru, La Union, Rio Huacamayo, Carabaya, 2000 feet; Santo Domingo, 6000 feet (G. Ockenden, Mus. Druce).
Fam. Lithosidæ.

*Chrysochlorosia superba*, sp. n.

**Male.**—Head, collar, tegulae, thorax, and abdomen metallic green; antennæ metallic green, the tips white; the anus bright metallic blue; the underside of the abdomen reddish; the legs metallic blue-green. Primaries metallic orange-blue and green, broadly bordered with black on the outer margin; the fringe bright metallic blue: secondaries black. Under-side of both wings greenish black.

*Hab.* Colombia, Rio San Juan, 250 feet (G. M. Palmer, Mus. Druce).

*Ptychoglene phœbe*, sp. n.

**Male.**—Head, antennæ, tegulae, and thorax brownish black; collar white; abdomen black, each segment edged with white; underside of the abdomen white; legs brownish black. Primaries orange-yellow, the costal margin, apex, and outer margin broadly black, the inner margin edged with black; the fringe black: secondaries orange-red, bordered with black from the apex to the anal angle; two black streaks at the base of the wing; the apical half of the fringe black, the anal half orange-red. Underside very similar to the upperside, but paler in colour.

*Hab.* East Peru, Huancabamba, 6000–10,000 feet (Boettger, Mus. Druce).

Fam. Lasiocampidæ.

*Chrysopoloma opalina*, sp. n.

**Male.**—Head, collar, tegulae, thorax, abdomen, and legs pale cream-colour; antennæ pale brown. Primaries pale cream-colour; an indistinct row of brownish-black dots crosses the wing from near the apex to the inner margin close to the anal angle, the spot on the inner margin much the largest; secondaries pale cream-colour, crossed from the apex to the inner margin by a double row of indistinct black dots, also a marginal row of very indistinct dots extends from the apex to the anal angle; the fringe of both wings pale cream-colour. — *Female* very similar to the male, but much larger, very thinly clothed with scales and quite opalescent; the tips of the antennæ black.

Expanse, ♂ 1\(\frac{3}{4}\), ♀ 2\(\frac{1}{2}\) inches.

Allied to Chrysopoloma subiridescentis, Holland, and Chrysopoloma citrina, Druce.

Fam. Limacodidæ.

Dalicerca semirufa, sp. n.

Male.—Head, collar, tegulae, thorax, and abdomen yellow; antennae and legs black. Primaries red, the costal and outer margin greenish yellow; secondaries yellow, broadly bordered from the apex to the anal angle with black; the fringe yellow. Underside of both wings yellow, broadly bordered with black.

Expanse 1½ inch.

Hab. Colombia, Río San Juan, Chaco, 150 feet (G. M. Palmer, Mus. Druce).

Birthama (?) dodona, sp. n.

Male.—Head, collar, tegulae, thorax, abdomen, and legs chrome-yellow; antennae and palpi black. Primaries chrome-yellow, the veins darker; a straight brown line crosses the wing from the apex to the inner margin close to the base; the fringe brownish yellow; secondaries chrome-yellow, paler than the primaries; the underside of both wings chrome-yellow, entirely without markings.

Expanse 2 inches.

Fam. Notodontidæ.

Pheosia ockendeni, sp. n.

Male.—Head, collar, tegulae, and thorax dark grey, mixed with white hairs; palpi black; antennae pale brown; abdomen black, the two anal segments grey, underside of the abdomen yellowish white; legs dark grey. Primaries dark grey, shaded with reddish brown on the costal margin near the apex; a double black line crosses the wing beyond the cell from the costal to the inner margin; a second double black line crosses the wing near the base from the costal to the inner margin, the inner margin clouded with black; two reddish-brown spots edged with black at the end of the cell; the marginal line black; fringe grey: secondaries white, the

costal margin from the base to the apex blackish grey, the marginal line black; the fringe white. **Underside:** primaries grey, reddish brown along the costal margin; secondaries white.

**Expanse 2 inches.**

**Hab.** North-east Peru, Aqualani, 10,000 feet, wet season (*G. Ockenden, Mus. Druce*).

**Fam. Noctuidae.**

**Subfam. ACRONYCTINAE.**

*Erocha trita*, sp. n.

**Male.**—Head, abdomen, and legs black; collar, tegulae, and thorax grey; the anal tuft reddish brown. Primaries grey, very thickly irrinated with black scales; a round black spot in the cell and an oval-shaped spot at the end of the cell; a zigzag rather broad white line crosses the wing near the base from the costal to the inner margin; a second zigzag line crosses the wing beyond the cell, ending in a large white spot close to the anal angle; the primaries are very similar to those of *Erocha dolens*, Druce: secondaries pale cream-yellow, the marginal line black; the fringe white. **Underside** similar to the upperside, the costal margin and the apex of the primaries black.

**Expanse 2 inches.**

**Hab.** S.E. Peru, Aqualani, 10,000 feet (*G. Ockenden, Mus. Druce*).

*Isodemia buckleyi*, sp. n.

**Female.**—Head and palpi black above, underside of palpi pale brown; collar, tegulae, thorax, and abdomen dark brown, underside of the abdomen pale brown. Primaries dark brown, pale brown at the base and partly across the wing; two spots in the cell; two zigzag black lines cross the wing from the costal to the inner margin, the first nearest the base, the second beyond the cell; a pale brown patch at the apex crossed with black spots; a submarginal light brown line with black points extends from apex to the anal angle; the marginal line black; the fringe dark brown; secondaries uniformly brown, the fringe slightly paler in colour. **Underside** of both wings brown.

**Expanse 2½ inches.**

**Hab.** Ecuador, Sarayacu (*Buckley, Mus. Druce*).
Iscaidia variegata, sp. n.

Female.—Head, collar, tegulae, thorax, and abdomen grey irrorated with black hairs, collar edged with black; antennae greyish brown; palpi grey, the point black; underside of the abdomen and legs greyish white. Primaries grey, heavily marked with brown along the costal margin; a waved black line crosses the middle of the wing from the costal to the inner margin; an indistinct zigzag white line crosses from near the apex to the anal angle; a marginal row of small black spots extends from the apex to the anal angle; a black spot at the end of the cell; the fringe dark grey: secondaries brownish white, deeply shaded with brown at the apex and partly round the outer margin. Underside: primaries greyish black, the inner margin white: secondaries the same as above.

Expanse 1½ inch.

Hab. Trinidad, Caparo (S. M. Klages); Colombia, Don Amo, 2000 feet (H. H. Smith); S. E. Peru, Santo Domingo, 6000 feet (G. Ockenden, Mus. Druce).

Alveognatha nitescens, sp. n.

Male.—Head, antennae, collar, tegulae, thorax, and abdomen very dark grey; the underside of the thorax, legs, and abdomen pale grey. Primaries grey, thickly irrorated with fine black scales; a black spot in the middle of the cell and one at the end of the cell; a dark grey mark near the apex, below which are several black spots; the outer margin spotted with black; the fringe grey: secondaries white, slightly edged with pale brown at the apex; the fringe white. Underside: primaries pale grey, with three black spots on the costal margin near the apex: secondaries as above.—Female the same as the male, but larger and more heavily marked.

Expanse, ♂ 1½, ♀ 1¾ inch.

Hab. Peru, Oconeque, Carabaya, 7000 feet (G. Ockenden, Mus. Druce).

Elveognatha melanosticta, sp. n.

Male.—Head, collar, tegulae, and thorax dark grey, the third joint of the palpi black, the base of the thorax mottled with white; abdomen blackish brown, anal tuft white; underside of the abdomen and legs yellowish white. Primaries grey, the base heavily mottled with white, crossed by several black lines; a submarginal waved pale grey line extends
from the apex to the anal angle; the marginal line spotted with black; secondaries greyish white, the underside of both wings pale grey.—**Female** very similar to the male, but darker in colour.

*Expanse* 1½ inch.

*Hab.* S.E. Peru, La Oroya, Rio Inambari, 3000 feet; Santo Domingo, 6000 feet (*G. Ockenden, Mus. Druce*).

**Elæognatha purpurascens**, sp. n.

*Male.*—Head, palpi, antennæ, collar, tegulae, thorax, and abdomen greyish black, the underside of the abdomen and legs yellowish white. Primaries dark grey; a small black spot at the base, one in the cell, and one at the end of the cell; a greenish spot on the inner margin close to the base, edged with white; a reddish-brown spot near the apex, streaked with black; a marginal row of small black dots extends from the apex to the anal angle: secondaries brownish white. Underside of both wings pale brown.

*Expanse* 1½ inch.

*Hab.* S.E. Peru, Rio Inambari, 3000 feet (*G. Ockenden, Mus. Druce*).

**Elæognatha cacaonis**, sp. n.

*Female.*—Head, palpi, collar, tegulae, thorax, and abdomen very dark blackish brown; antennæ black; legs grey. Primaries dark brown, thickly irrorated with white scales and lines; a grey mark on the costal margin close to the base, below which is a black band reaching the inner margin; several white waved lines extend from the apex to the anal angle; the marginal line spotted with black; the fringe brown: secondaries dark blackish brown, the fringe grey. Underside of both wings black.

*Expanse* 1¾ inch.

*Hab.* W. Central Trinidad, Caparo (*F. Birch, Mus. Druce*).

Fam. **Ægeridæ**.

**Melittia rugia**, sp. n.

Head, antennæ, tegulae, thorax, and abdomen black; collar white; palpi white, tipped with black; legs black, clothed with black hairs; the terminal joint clothed with bright red hairs. Primaries bluish black, the cell hyaline, the fringe black: secondaries hyaline, the veins and fringe black, the inner margin from the base to the anal angle thickly
clothed with metallic bluish-green scales. The underside similar to the upperside.

Expanse 1½ inch.

_Hab._ Peru, Chanchamayo, 1000-1500 metres (Mus. Druce).

Ægeria belia, sp. n.

_Male._—Head, collar, thorax, and abdomen bluish black, abdomen and thorax white on the underside; antennæ black; palpi black, white on the underside; legs black. Primaries black; a spot at the end of the cell; a band beyond the cell extending from the costal margin to the anal angle, and a streak from the base along the inner margin all hyaline, the band near the apex crossed by black veins: secondaries hyaline, the veins black, the fringe black.

Expanse 1½ inch.

Fam. Pyralidae.

Subfam. Chrysauginae.

Tamyra klagesi, sp. n.

_Female._—Head, collar, tegulae, and thorax pinkish fawn-colour, the tegulae edged with reddish brown; palpi very long, tufted at the end, black above, fawn-colour on the underside; antennæ reddish brown; abdomen reddish brown; legs brown. Primaries: the costal half of the wing pale fawn-colour, irrated with minute dark brown scales; the inner half of the wing and the outer margin reddish brown, darkest about the middle of the inner margin; a submarginal black waved line extends from the apex to vein 1; the fringe reddish brown: secondaries pinkish white, darkest at the apex and round the outer margin. Underside pinkish white, the apex and outer margin of both wings reddish brown; a black spot at the end of the cell of both wings.

Expanse 2¼ inches.

_Hab._ Trinidad, Caparo (S. M. Klages, Mus. Druce).

Allied to Tamyra penicillana, Herr.-Schäff.

Subfam. Epipaschiinae.

Macalla argentilinea, sp. n.

_Male._—Head pale brown, collar and tegulae white streaked with pale brown; antennæ brown; abdomen pale brown,
spotted with black on each side; legs pale brown. Primaries pale yellowish brown, crossed from the costal to the inner margin by two silvery-white lines, the first near the base, the second at the end of the cell; the lines are edged with black on the inner side; a large oval-shaped white spot, thickly irrorated with pale brown scales on the outer margin close to the anal angle, edged with black, the marginal line black; two black streaks at the apex; the fringe silvery brown: secondaries dusky white, darkest at the apex. Underside brownish white.

Expanse 1½ inch.  
_Hab._ S.E. Peru, Santo Domingo, 6000 feet (G. Ockenden, **Mus. Druce**).

**Macalla viridis,** sp. n.

_Male._—Head, palpi, and antennae pale brown; collar and tegulae pale pea-green; thorax and abdomen pale brown. Primaries pea-green, fading to yellowish brown; a silvery-brown line crossing the wing from the costal margin to the inner margin close to the base, a second about the middle of cell, which extends partly along the inner margin almost to the anal angle, then crosses the wing to the apex, curves round the end of the cell to just above vein 1; a dark oval-shaped mark at the end of the cell, edged with pale brown, the marginal line silvery brown: secondaries silky white. Underside: primaries pale pinkish brown, secondaries white.  
Expanse 1¼ inch.  
_Hab._ S.E. Peru, Santo Domingo, 6000 feet (G. Ockenden, **Mus. Druce**).

**Macalla rufilinea,** sp. n.

_Male._—Head, thorax, and abdomen grey; collar and tegulae reddish brown. Primaries grey, thickly irrorated with dark brown scales; five reddish-brown lines cross the wing beyond the cell, forming a network to the outer margin; the fringe alternately reddish brown and grey: secondaries silky white, shaded with blackish brown at the apex. Underside: primaries blackish brown, secondaries as above.—_Female_ very similar to the male, but larger and more heavily marked with reddish-brown lines on the primaries; the secondaries are also blacker round the outer margin.  
Expanse, ♂ 1¾, ♀ 1½ inch.  
_Hab._ S.E. Peru, Santo Domingo, 6000 feet (G. Ockenden, **Mus. Druce**).
Macalla rufibasis, sp. n.

*Male.*—Head, palpi, collar, tegulae, and thorax brownish red; antennae brown; abdomen grey. Primaries dark grey, the basal half brownish red; two waved whitish lines cross the wing from the costal to the inner margin, the first at the end of the cell, the second submarginal; a reddish-brown spot at the apex; the marginal line black; the fringe white: secondaries sordid white, the marginal line black. Underside: primaries pale brown; secondaries the same as above, with the costal margin broadly brown.

Expanse 1½ inch.

*Hab.* Peru, Rio Huacamayo, Carabaya, 3100 feet (*G. Ockenden, Mus. Druce*).

Subfam. Crambinae.

*Erupa titana,* sp. n.

*Male.*—Head, palpi, collar, tegulae, thorax, and abdomen dark brown; underside of the abdomen and legs yellowish brown. Primaries dark glossy brown, crossed from the apex almost to the middle of the inner margin by a waved yellow line; a large yellow >-shaped mark crosses the wing about the middle from the costal to the inner margin; the point of the > is at the end of the cell; a marginal row of black spots with yellow points extends from the apex to the anal angle; the fringe dark brown: secondaries very dark brown. Underside of both wings glossy dark brown, with a pinkish tinge: primaries, a dark spot at the end of the cell, the costal and outer margin edged with yellow: secondaries, the outer margin edged with yellow and a black spot at the end of the cell.

Expanse 2½ inches.

*Hab.* S.E. Peru, Santo Domingo, 6000 feet (*G. Ockenden, Mus. Druce*).

*Erupa argentilinea,* sp. n.

*Male.*—Head, palpi, antennae, collar, tegulae, and thorax dark reddish brown; abdomen pale yellow, almost cream-colour. Primaries reddish brown, crossed from the costal to the inner margin by three broken curved silver lines; a marginal row of small silver spots extends from the apex to the anal angle; the fringe reddish brown: secondaries cream-colour, with the outer margin slightly dusky. Underside of both wings pale reddish brown.

Expanse 1½ inch.

*Hab.* West Colombia, San Antonio, 5800 feet (*M. G. Palmer, Mus. Druce*).
Euryglossa chrysoceras, Ckll., aiul E. suhsericea, Ckll.

A male E. chrysoceras comes from The Ridges, Mackay, Queensland, at flowers of Leptopermum, Oct. 1898 (Turner j 702). British Museum. At the same flowers were taken females of E. suhsericea, Ckll., and these also bear the number 702, being evidently considered conspecific with chrysoceras. The two insects are so different that it seems improbable that they can be sexes of one, and, moreover, I believe the true male of E. suhsericea to be Turner's 1 «, taken in some numbers at flowers of Le/dospennuni, at the same locality, Sepf. and Oct. 1898. This insect has every appearance of E. sxihsericea, except for the usual sexual differences and the fact that the head and thorax are dark green instead of black. A very characteristic feature, seen in both sexes, is the dull minutely sculptured front, abruptly contrasting with the shining strongly punctured vertex.

The abdomen of the male is shining, in the female it is dull. The venation varies, the first r. n. sometimes squarely meeting the first t.-c. The male (Turner's 1 a) is the insect mentioned by Baker ('Invertebrata Facifica,' May 1906, p. 141) as iStilpnosoma turneri. Prof. Baker has kindly sent me his specimen, which proves to be from Maekay, Sept. 1898,
collected by Turner, the name S. turneri being a manuscript one by Friese.

XVII. — Descriptions of some new Species of Heterocera from East and West Africa and Tropical South America, \(^y\) by Herbert Druce, F.L.S. &c.

Fam. Agaristidae.

Copidryas peruviana, sp. n.

J/J/a?.— Head, collar, tegula?, and thorax brown, thickly irrorated with grey hairs; antennae and palpi black; abdomen yellow, with a black tuft of hairs at the base, the underside greyish yellow, the legs yellow. Primaries pale brown, thickly irrorated with white and greenish-coloured scales; two zigzag black lines cross the wing beyond the cell from the costal to the inner margin; a small brown spot in the cell; the inner margin brown from the base to the anal angle; the fringe alternately brown and white: secondaries chrome-yellow, bordered with black from the apex almost to the anal angle;
with a black dot at the end of the cell, and beyond a broken
black bar that does not leave either margin, the apex and
outer margin brown. — Female the same as the male, but
rather darker in colour.

Expanse \(2^\text{\textdegree}\) inches.

Ihib. y. K. \(1^\text{fru}\), Santo Domingo, GOOO feet, wet season
(Cr. Ockjucltin, Mas. Druce).

Tuerta rema, sp. n.

Male. — Head, palpi, and antennae black, the base of the
antenna; white; collar, tegulae, and thorax reddish brown,
thickly irrorated with white hairs; abdomen pale yellow.
Primaries: the costal half of the wing from the base to
beyond the cell white, the outer half of the cell pale green;
a reddish-brown band extends from the apex to the anal angle
and along the inner margin to the base of the wing thickly
irrorated with white scales, the inner side of the brown band
broadly olive-green, the outer margin and fringe white:
secondaries pale yellow, the fringe white; a small black line
close to the anal angle. Underside of both wings uniformly
pale yellow.

Expanse \(1^\text{\textdegree}\) inch.

JJaO. German East Africa (\(^\text{\textsc{fus}}.\) Druce).
Diacrisia pales, sp. n.

Male. — Head, collar, tegula3, and front of the thorax orange-yellow, the thorax and basal part of the abdomen pale yellow, antennae and legs black, the abdomen black, the anus yellow. Primaries pale yellow: secondaries yellowish white, darkest along the inner margin. — The ewia/e the same as the male.

Expanse 1| inch.

Allied to Diacrisia lurida, Druce.

Lophocampa dissimilis, sp. n.

Mule and female. — Head chrome-yellow; paljji and antennae black; collar white, edged with chrome-yellow; tegula chrome-yellow, edged with white; thorax and abdomen black, some yellowish-brown hairs at the base of the...
thorax, abdomen spotted with yellow on the upper side and sides, the two anal segments, the anus, and underside yellowish white; the legs black. Primaries sordid white, the apex and part of the outer margin clouded with yellow brown, the veins and a bar at the end of the cell yellow brown, the fringe greyish white: secondaries similar to the primaries, but more dusky on the inner margin.

Expanse, (J 2, 2J inches.

Jlah. Peru, (llanchamayo, 1000 to 1500 metres (J/wo.

This species is allied to Lophocampa liumosa, Dogn., from Ecuador.

Pericopis imitata, sp. n.

Male. — Head, antennae, collar, thorax, base of the abdomen, and legs black; two yellow spots at the back of the head and two at the base of the primaries; abdomen black, with a row of bluish-grey spots on each side, below which on the sides a row of very minute white dots; the underside spotted with yellow; the anal tuft bright red. Primaries very similar to those of 7. arema. Boisd., but browner and not so hyaline, without the broad black band across the wing
at the end of the cell as in P. arema; a faint marginal zigzag line extends from the apex to the anal angle; the fringe black: secondaries pale yellowish white, very broadly bordered with black at the end of the cell; two yellowish-white spots; a marginal row of white spots from near the apex to the anal angle. The underside very similar to the upperside, a red spot at the base of both wings.

Expanse, (5? , 3 inches.

[Jab. Peru, Limbani, Carabaya, 9500 feet, ^ ^ , 1 ? ; Rio Huacamayo, 3100 feet, 2 ^ ; Oconeque, 7000 feet, 1 ^ ; Aqualani, 10,000 feet, 4 c? (G^- Ockenden). Brazil, 1 ^ {ex Staudhiffer, Miis. Druce).

Near P. arema, Boisd., but at once distinguished from that species by the blues-grey sides to the abdomen.

Pericopis titan, sp. n.

Female. — Head, antennae, palpi, collar, tegula?, thorax, abdomen, and legs all black; collar spotted with white; a yellow spot at the base of the tegula; the sides of the abdomen greenish grey, with a row of white dots below the underside yellow. Primaries blackish grey, marked with black very much the same as Pericopis imitata, Druce: secondaries white, broadly bordered with black; two white spots just
new Species of litterocera. 171

beyond illic cell; the veins black; a nai-inal row of ratlier
biifc white spots extends Irotn the apex to tho anal angle.
Underside similar to the upperside; a large red spot at the
base of both wings and u white spot on each side of tho
thorax.

Kx pause 3 inches.

llah. Peru, Chanchauiyayo, 1000 to 1500 metres (Mua.
Druce).

Pericopis pahneriy sp. n.

Male. — Head, antennaj, c )llar, tegulie, thorax, and lefr.s
black; tegulite edged with yellow; abdomen black; a row
of large yellow spots on both sides; the underside yellow;
anal tuft red. Primaries dark brown; a red spot at the
base; a yellow streak on the inner margin; the semih valine
markings very similar to those of Pericopis imitata, Druce,
but mostly edged with yellow; the spot in the cell extends
to the base; a fine submarginal yellow line extends from
the apex to the anal angle; the fringe dark brown; second-
aries white, the veins and a bar at the end of the cell black;
the outer margin broadly black, with a row of red spots from
the apex to the anal angle and a marginal row of white dots
also from the apex to the anal angle. Underside: primaries
the same as above, but with several reddish marks along the
outer margin: secondaries similar to the upperside, the costal
margin red. — Female. Head, antennae, collar, tegulae, and
thorax black; abdomen the same as the male. Primaries
brown, the markings much more indistinct: secondaries pale
yellow, very broadly bordered with black; a yellow spot at
the end of the cell; the costal margin red; the marginal red
and white spots the same as the male; the fringe black.
Underside: primaries very similar to the upperside, but
much paler in colour: secondaries the same as the upperside,
with all the red markings very bright in colour; the white
row of marginal spots are larger and more distinct.

Expanse, (J 2J, ? 3 inches.

Hah. West Colombia, San Antonio, 5800 feet [G. M.
P.iliuir]; East Peru, Puzuzo (J. Ellr/, 2000-4000 feet,
Miu. iJruce).

Pericopis damon, sp. n.

Female. — Head, antennae, collar, tegulae, and thorax
black, the head, collar, and tegulae spotted with white; abdo-
men black above, yellowish white on the underside; legs
black. Primaries dusky hyaline, the apex, outer and inner
margin broadly black; two black bands cross the wing, that
amost the base from the costal to the inner margin; the
band at the end of the cell from the costal to the outer
margin; the veins all black; secondaries yellowish hyaline,
broadly bordered with black from the apex to the anal angle;
a marginal row of rather large white spots extends from the
apex to the anal angle; a black band crosses the wing at the
end of the cell from the costal to about the middle of the
outer margin; the veins and fringe black. Underside very
similar to the upperside, but slightly more yellow in tone.

Expanse 3 inches.

Hab. Peru, Cianchamayo, 1000-1500 metres (Mas.
Druce).

Pticopis semirufa, sp. n.

Female. — Head and antennae black, head spotted with
white; collar black, spotted with yellow; tegulee black, with
a yellow spot at the base; thorax brownish black; abdomen
reddish brown, yellow on the underside; legs black. Pri-
maries brownish hyaline, the costal margin, apex, outer and
inner margin, and two bands crossing the wing all black:
secondaries reddish hyaline, the outer margin black, with a
marginal row of white spots extending from the apex to the
anal angle; above the black margin a red band extends from
the apex to the anal angle; the fringe black. Underside very
similar to the uperside; primaries with a red band at the
apex and a reddish spot above the anal angle; secondaries
with the costal margin red.

Expanse 3½ inches.

Hab. Peru, Chianchamayo, 1000-1500 metres (Mas,
Druct).

Pericops sylvia, sp. n.

Female. — Head, palpi, antenna?, collar, tegulre, and thorax
black, collar and tegulai spotted with white; abdomen grey,
the sides black; the underside pale yellow; legs black.
Primaries greyish hyaline, the costal margin, apex, outer and
inner margin black; a reddish-brown line extends along the
inner margin from the base nearly to the apex; a black band
crosses the wing about the middle of the cell from the costal
to the inner margin; a black band at the end of the cell, a
few white dots at the apex, and several indistinct brown spots
on the inner side of the white dots: secondaries semihyaline
white, the veins and a bar at the end of the cell black; the
outer margin broadly black from the apex to the anal angle,
neio Sj)ecies of ltterocera. 1 73

and a rriar<.Miial row of nitlicr Inr;r( . white spots. Underside very similar to tlie uppersidc, but with the costal mai«, 'in of tlie secondaries from the base almost to the apex cluumu-
yellow.

Expanse ?\ inches.

|lib. Peru, Chanchamayo, 1000-1500 metres [Mus.
Jh-uo).

Pericopis niadana, sp. n.

Female. — Head, palpi, antennre, collar, tcfrrula?, thorax, and abdomen black, the cttdlar spotted with white, abdomen with a bluish-grey band on each side; the utnliirsde pale yell \v; legs black. Primaries brownish grey, the apex, inner margin, and two bands crossing the wings all black ; several small white sj)ots at the apex, below which are some indistinct reddish-brown spots, also two reddish-brown spots close to the anal angle ; a bright red spot at the base : secondaries white, the veins all black ; the inner half of the wing thickly clutlied with black hairs; the outer margin broadly bordered
with black, with a submarginal row of indistinct reddish spots and a marginal row of white spots extending from the apex to the anal angle; the fringe black. Underside similar to the upperside, but with nearly all the black markings red.

Expanse 3 inches.

IJab. West Colombia, San Antonio, 5800 feet (G. M. Palmer, Mus. Druce).

A very distinct species, quite unlike any other known to me.

Pericopis hodeva, sp. n.

Female. — Head, antennae, collar, tegum, thorax, and legs all black; collar spotted with yellow, tegum edged with reddish brown; abdomen above reddish brown, with a central black line down the middle from the base to the anus; a double black line on each side; the underside pale yellow; the anal segment bluish grey. Primaries: the apical third of the wing black, from the end of the cell to the base brownish yellow, clouded in the cell and along the inner margin with brown; the veins black; the fringe black; a yellow line at the end of the cell; secondaries black, yellowish brown at the apex and half round the outer margin. Under-side very similar to the upperside, but brighter in colour, and a distinct black spot about the middle of the cell on the primaries.
Female. — Head, |alpi, antcmia% collar, and tegulne black, collar spotted with yellow ; thorax yellowish brown, clothed with some black hairs ; abdomen yellowish brown, with a central black line from the base to the anus ; a narrow black line on each side ; the underside pale yellow. Primaries: the apical third of the wing brownish black, the other two-thirds of the wing dark orange-yellow, the veins black; a black bar at the end of the cell and an ill-defined black band crossing the wing from the costal margin to the upperside of vein 2 ; the fringe black : secondaries dark orange-yellow, the outer margin and a wide band partly across the middle of the wing below the cell black. Underside very similar to the upperside, but brighter in colour.

Expanse 3\ inches.
Pericopis staudingeri, sp. n.

Female. — Head, palpi, antennae, collar, tegulae, and thorax black, head and tegulae spotted with white; abdomen red, with a central black band extending from the base to the anus; a black band on each side; the underside yellow; legs black. Primaries brownish black, crossed from the costal margin nearest the apex to the anal angle by a cream-coloured wide band; a black bar at the end of the cell; secondaries bright red, the outer margin black from the apex to the anal angle; a broken black band crosses the wing below the middle. Underside very similar to the upperside, with the inner margin of the primaries yellowish brown; the secondaries with a large round yellow spot at the end of the cell.

Expanse 3\(^\text{\circ}\) inches.

Hab. Peru, Cuzco (received from the late Dr. Staudinger); S.E. Peru, Santo Domingo, 6000 feet (G. Ockendtn, Mas. Druce).

Pericopis buckleyi, sp. n.

Female. — Head, palpi, antennae, collar, tegulae, thorax, abdomen, and legs black. Primaries dark brown, darkest at the base; a red spot on the costal margin close to the base;
the fringe dark brown: secondaries black, three pale yellow
spots between veins 5, 6, and 7 near the apex; a rose-
coloured band extending from the anal angle to vein 4; the

Fam. Pyralidae.

Subfam. CnS\text{SAUG}iy*.

Tamyra klagesi, sp. n.
Female. — Head, collar, tegulte, and thorax pinkish fawn-colour, the tegulae edged with reddish brown; palpi very long, tufted at the end, black above, fawn-colour on the underside; antennae reddish brown; abdomen reddish brown; legs brown. Primaries: the costal half of the wing pale fawn-colour, irrorated with minute dark brown scales; the inner half of the wing and the outer margin reddish brown, darkest about the middle of the inner margin; a submarginal black waved line extends from the apex to vein 1; the fringe reddish brown: secondaries pinkish white, darkest at the apex and round the outer margin. Underside pinkish white, the apex and outer margin of both wings reddish brown; a black spot at the end of the cell of both wings.

Expanse 2\(^\text{\textdegree}\) inches.

JJab. Trinidad, Caparo [S. M. Klages, Mus. Druce).

Allied to Tamyra penicillana, Ilerr.-Schatf.

Subfam. EpiPABCEiyljB.

Macalla argentilinea, sp. n.

fule. — Head pale brown, collar and tegulae white streaked with pale brown; antennae brown; abdomen pale brown,
spotted with black on each side; legs pale brown. Primaries pale yellowish brown, crossed from the costal to the inner margin by two silvery-white lines, the first near the base, the second at the end of the cell; the lines are edged with black on the inner side; a large oval-shaped white spot, thickly irrorated with pale brown scales on the outer margin close to the anal angle, edged with black, the marginal line black; two black streaks at the apex; the fringe silvery brown; secondaries dusky white, darkest at the apex. Underside brownish white.

Expanse 1\(^1/2\) inch.

Hab. S.E. Peru, Santo Domingo, 6000 feet (G. Ockenden, Mus. Druce).

Ufacalla viridis, sp. n.

Male. — Head, palpi, and antennse pale brown; collar and tegulae pale pea-green; thorax and abdomen pale brown. Primaries pea-green, fading to yellowish brown; a silvery-brown line crossing the Aving from the costal margin to the inner margin close to the base, a second about the middle of cell, which extends partly along the inner margin almost to the anal angle, then crosses the wing to the apex, curves
round the end of the cell to just above vein 1; a dark oval-shaped mark at the end of the cell, edged with pale brown, the marginal line silvery brown: secondaries silky white. 
Underside: jirimaries pale pinkish brown, secondaries white.

Expanse 1\(\frac{1}{4}\) inch.

J:lab. y.E. Peru, Santo Domingo, 6000 feet (G. Ochenden^ Mus. Druce).

Macalla rvJUinea^ sp. n.

Male. — Head, thorax, and abdomen grey; collar and tegulaj reddish brown. Primaries grey, thickly irrorated with dark brown scales; five reddish-brown lines cross the wing beyond the cell, forming a network to the outer margin; the fringe alternately reddisli brown and grey: secondaries silky white, shaded with blackish brown at the apex. Underside: primaries blackish brown, secondaries as above. — Female very similar to the male, but larger and more heavily marked with reddish-brown lines on the primaries; the secondaries are also blacker round the outer margin.

Jlab. S.E. Peru, Santo Domingo, 6000 feet (G. OcJcenden, Mus. Druce).
MucaUa riiijxisig^ sj). n.

Male. — Lloiu, pilpi, Collar, tegulu, and thorax brownish red; uiiitonriie brown; abdomen grey. Primaries dark ^rey, the basal half brownish red; two waved whitish lines cross the wiiil,* from the costal to the inner mar<^in, the first at the end of the cell, the second .submar^inal ; a reddish-brown spot at the apex; the marginal line black; the frinf^e white: secondaries sordid white, the marginal line black. Underside:

j)rirnaries pale brown; secondaries the same us above, with the costal margin broadly brown.

Hx)aiise 1^ inch.

Subfam. CjtA2fBiyj2.

Erupa titana, sp. n.

Male. — Head, palpi, collar, tetrulae, tiiorax, and abdomen dark brown; underside of the abdomen and legs yellowish brown. Primaries dark glossy brown, crossed from the apex
almost to the middle of the inner margin by a waved yellow line; a large yellow >-shaped mark crosses the wing about the middle from the costal to the inner margin; the point of the > is at the end of the cell; a marginal row of black spots with yellow points extends from the apex to the anal angle; the fringe dark brown: secondaries very dark brown. Underside of both wings glossy dark brown, with a pinkish tinge: primaries, a dark spot at the end of the cell, the costal and outer margin edged with yellow: secondaries, the outer margin edged with yellow and a black spot at the end of the cell.

Expanse 2;\(^{\circ}\) inches.

Hub. kS.E. Peru, iSanto Domingo, 6000 feet (G. Ockenden, Mas. Uruce).

Erupa argentilijiea, sp. n.

Male. — Head, palpi, antennje, collar, tegulap, and thorax dark reddish brown: abdomen pale yellow, alniust cream-colour. primaries reddish brown, crossed from the costal to the inner margin by three broken curved silver lines; a marginal row of small silver spots extends from the apex to the anal angle: the fringe reddish brown: secondaries crem-colour: with the outer margin slightly dusky. Underside of both wings pale reddish brown.

Expanse 2;\(^{\circ}\) inch.
